
Summary

Versatile AI & Machine Learning Lead and CEO of Nordlytics AB with over 10 years of experience delivering high-impact, automated solutions. Expert in the full ML lifecycle, from LLMs and Computer Vision to time series forecasting, with hands on experience from Fortune 500 and utility leaders like E.ON. Proven track record in building scalable data platforms using Python, PyTorch, and Spark within AWS/Kubernetes environments. Combines deep technical knowledge with strategic stakeholder communication to transform complex data into autonomous, production-ready systems.

Work Experience

Nordlytics AB - CEO (2021 - Now)

My own consultancy with focus on developing AI and Machine Learning solutions for following clients:

Project for non-disclosed client - Senior Machine Learning Engineer - 2026-Now

Developing full-stack webapp with AI based solution for client using computer vision and MLOps. Responsibility for full infrastructure with deployment of webapp, backend, database and model inference pipeline on AWS using Terraform. Model training and life-cycle managed using MLFlow. Deployment of model targeting edge inference on thin devices inside webapp.

Apple - Senior Machine Learning Engineer - 2021-2025

Developing ML/AI based solutions to clean, combine and augment data from many diverse sources. Project resulted in a fully automated solution with minimal human interaction, and gave remarkable improvements over the previous labor intensive process. Models developed in the process range from SVMs to LLMs. I have been involved in all stages from conception and planning up through data gathering/annotation, training, validation, final production deployment and operation including continuous updates of running models and communication with stakeholders.

E.ON – Senior Machine Learning Engineer – 2018-2021

Fully Automated Time-Series Forecasting Platform - Power Grid

Led the design and deployment of an end-to-end forecasting pipeline that ingests raw grid data, cleans it, engineers features, trains diverse models (OLS to Seq-to-Seq quantile regression), and surfaces real-time metrics in the operator UI. The enhanced accuracy (60 % lower MAE) enabled operators to reduce peak-surplus generation by 67 %, cut monthly procurement spend, and shift load toward green sources - lowering carbon intensity.

Computer-Vision Vegetation Segmentation - Transmission Corridors

Developed a deep-learning segmentation model that processes satellite imagery to flag vegetation encroachment along transmission corridors. The AI-driven alerts accelerated maintenance response time by 75 %, cut unplanned outages due to vegetation from 12 to 2 per year, and slashed inspection labor costs from ≈ 500 k SEK to ≈ 120 k SEK annually - yielding ≈ 380 k SEK in yearly savings and a markedly more reliable grid.

Sony Mobile Communications – Data Scientist – 2015-2018

Performed end-to-end data science projects that boosted user targeting and churn reduction. Built a scalable PySpark pipeline for ingesting 5 TB of logs, applied clustering to segment users, improving personalized marketing, and developed time-series models (Prophet, LSTM) predicting daily active users with $< 4\%$ error for capacity planning. Created churn prediction models (AUC 0.87) that guided retention strategies, cutting customer attrition by 8%. Maintained models via automated retraining and real-time monitoring dashboards. Designed and taught an organization-wide curriculum on data analysis and machine learning, mentoring 10+ analysts/engineers - raising self-served query volume by 40% and shortening insight cycles from weeks to days. This effort significantly increased revenue, lowered churn costs, and elevated company-wide data literacy.

Twilio – Software Developer w. Devops and Data Analysis focus – 2014-2015

Development and maintenance of SMS aggregation gateway. Analysis and forecasting of resource requirements based on periodic system load.

Steria – Software Developer and Team Lead – 2011-2014

Development and maintenance of import and export taxation system for the Danish tax ministry. Lead developer role with minor focus on project and team management.

Education

MSc in Computer Science Copenhagen University, 2008-2011

Coursework: Machine Learning, Statistics, Image Analysis and Computer Visison, Advanced Algorithms

Research: Implementation of the lattice Boltzmann method using CUDA and GPUs

BSc in Computer Science, Copenhagen University, 2005-2008

Coursework: Functional programming, Compiler design, Algorithms, Computer Graphics, Interaction Design, Linear Algebra, Calculus, Physics, Thermodynamics

Skills

Programming Languages:

Python, Java, Scala

AI/Machine Learning

Pytorch, Tensorflow, scikit-learn, Spark Mllib

Pandas, Polars, Spark/PySpark, Flink

Feature Engineering

Classical models (SVM, Gradient Boosting)

Seq-to-seq encoder-decoder, transformer models (BERT)

Parameter efficient fine tuning

Matplotlib, Bokeh

Model training, performance optimization and avoidance of data leakage

Explainable AI, Feature Importance, Feature Pruning, Shap

Time series processing and prediction

Customer segmentation, topic modelling

Image segmentation

Classification

Unsupervised Learning, Dimensionality reduction (t-SNE), Clustering (HDBSCAN)

Devops/ML Ops

Prepping models for production

Generating features in production setting

Docker

Kubernetes

Triton Server

AWS (EC2, EKS, EMR, S3, SageMaker)

ONNX
